DANMAP 2019

DANMAP 2019 - Use of antimicrobial agents and occurrence
of antimicrobial resistance in bacteria from food animals,
food and humans in Denmark

Contents

Table A4.1 Use of antimicrobial agents in pigs (mill. kg-doses), estimated total live biomass (mill. tonnes) and total DAPD per age group per year, Denmark

Figure A4.1 Indications for use of antimicrobial agents in pigs as recorded in Vetstat, DAPD, Denmark

Table A4.2 Use of antimicrobial agents in cattle (mill. kg-doses), estimated total live biomass (mill. tonnes) and total DAPD per age group per year, Denmark

Figure A4.2 Indications for use of antimicrobial agents in cattle as recorded in Vetstat, DAPD, Denmark

Table A4.4 Use of antimicrobial agents in fur animals (mill. kg-doses), estimated total live biomass (mill. tonnes) and total DAPD per age group per year, Denmark

Figure A4.3 Indications for use of antimicrobial agents in fur animals as recorded in Vetstat, DAPD, Denmark

Table A5.1 Total consumption of antimicrobial agents for systemic use in humans, kg active compound, Denmark

Table A5.2 Consumption of antimicrobial agents on special delivery at hospitals, DDD, Denmark

Figure A5.3 Bed-days and admissions to hospitals in Denmark, 2010-2019

Figure A5.4 Ratio between bed-days and admissions at regional level, Denmark, 2010-2019

Figure A5.5 Distribution of penicillins used in different age groups, percent of total in DDD per 1000 inhabitants per day, 2010 and 2019, Denmark

Figure A5.6 Distribution of fluoroquinolones in primary health care prescribed by medical specialities, based on DDD, Denmark

Table A5.7 Indication for use of fluoroquinolones prescribed in primary health care, DDD, Denmark

Table A6.1 Distributions of MICs and resistance (%) in *Campylobacter jejuni* from broilers (n=195) and cattle (n=101), Denmark

Table A6.2 Distribution of MICs and resistance (%) in *Campylobacter jejuni* from human cases reported as domestically acquired (n=94) and associated with travel abroad (n=59), Denmark

Table A6.3 Distributions (n, %) of AMR profiles in *Campylobacter jejuni* from broilers, cattle and human cases, Denmark

Table A6.4 Distribution of MICs and resistance (%) in *Salmonella* Typhimurium from Danish pigs (n=45) and pork (n=59), Denmark

Table A6.5 Distribution of MICs and resistance (%) in *Salmonella* Derby from Danish pigs (n=67) and pork (n=56), Denmark

Table A6.6 Distribution of MICs and resistance (%) in *Salmonella* Typhimurium from human cases reported as domestically acquired (n=97), associated with travel abroad (n=65) and of unknown origin (n=109), Denmark

Table A6.7 Distribution (n, %) of AMR profiles in *Salmonella* Typhimurium from pigs, pork and humans, Denmark

Table A6.8 Distribution of MICs and occurrence of resistance among haemolytic *Escherichia coli* from pigs (n=262), Denmark

Table A6.9 Distribution of MICs and occurrence of resistance among *Actinobacillus pleuropneumoniae* from pigs (n=116), Denmark

Table A6.10 Distribution of MICs and occurrence of resistance among *Streptococcus suis* (n=147) from pigs, Denmark

Table A7.1 Distributions of MICs and resistance (%) in *Escherichia coli* from broilers (n=159), cattle (n=175) and pigs (n=190), Denmark

Table A7.2 Distribution (n, %) of AMR profiles in indicator *Escherichia coli* from broilers (n=159), cattle (n=172) and pigs (n=190), Denmark

Table A7.3 Distribution of MICs and resistance (%) in ESBL/AmpC-producing *Escherichia coli* from cattle (n=25) and pigs (n=9) recovered by selective enrichment, Denmark

Table A7.4 Distribution of MICs and resistance (%) in ESBL/AmpC-producing *Escherichia coli* from broiler meat (Danish n=14; Import n=15), beef (Danish n=3; Import n=9) and pork (Danish n=9; Import n=15) recovered by selective enrichment, Denmark

Table A7.5 Distribution (n, %) of AMR profiles in *Escherichia coli* from animals and meat recovered by selective enrichment, Denmark

Table A7.6 Distribution (n, %) of MLST and ESBL/AmpC Enzymes combinations detected in the ESBL/AmpC producing *E. coli* isolates from broilers and broiler meat recovered by selective enrichment, Denmark

Table A7.7 Distribution of MICs and resistance (%) in *Enterococcus faecalis* (n=91) and *Enterococcus faecium* (n=100) from pigs, Denmark

Table A7.8 Distribution (n, %) of AMR profiles in *Enterococcus faecalis* (n=91) and *Enterococcus faecium* (n=100) from pigs, Denmark

Figure A8.1 *Escherichia coli*/piperacillin-tazobactam. Zone diameter distributions in invasive isolates from humans, 2018 and 2019

Figure A8.2 *Escherichia coli*/amoxicillin-clavulanic acid. Zone diameter distributions in invasive isolates from humans, 2018 and 2019

Figure A8.3 *Klebsiella pneumoniae*/piperacillin-tazobactam. Zone diameter distributions in invasive isolates from humans, 2018 and 2019

Table A4.1 Use of antimicrobial agents in pigs (mill. kg-doses), estimated total live biomass (mill. tonnes) and total DAPD per age group per year, Denmark

Note: A 'kg dose' is the defined daily dose (DADD) in kg active compound per kg live biomass per day. The DADDs are defined for each antimicrobial agent, administration route and animal species. Total DAPDs are calculated as the total estimated number of kg doses used per year divided by the estimated live biomass in the age group (in tonnes, cumulated over the 365 days in a year)

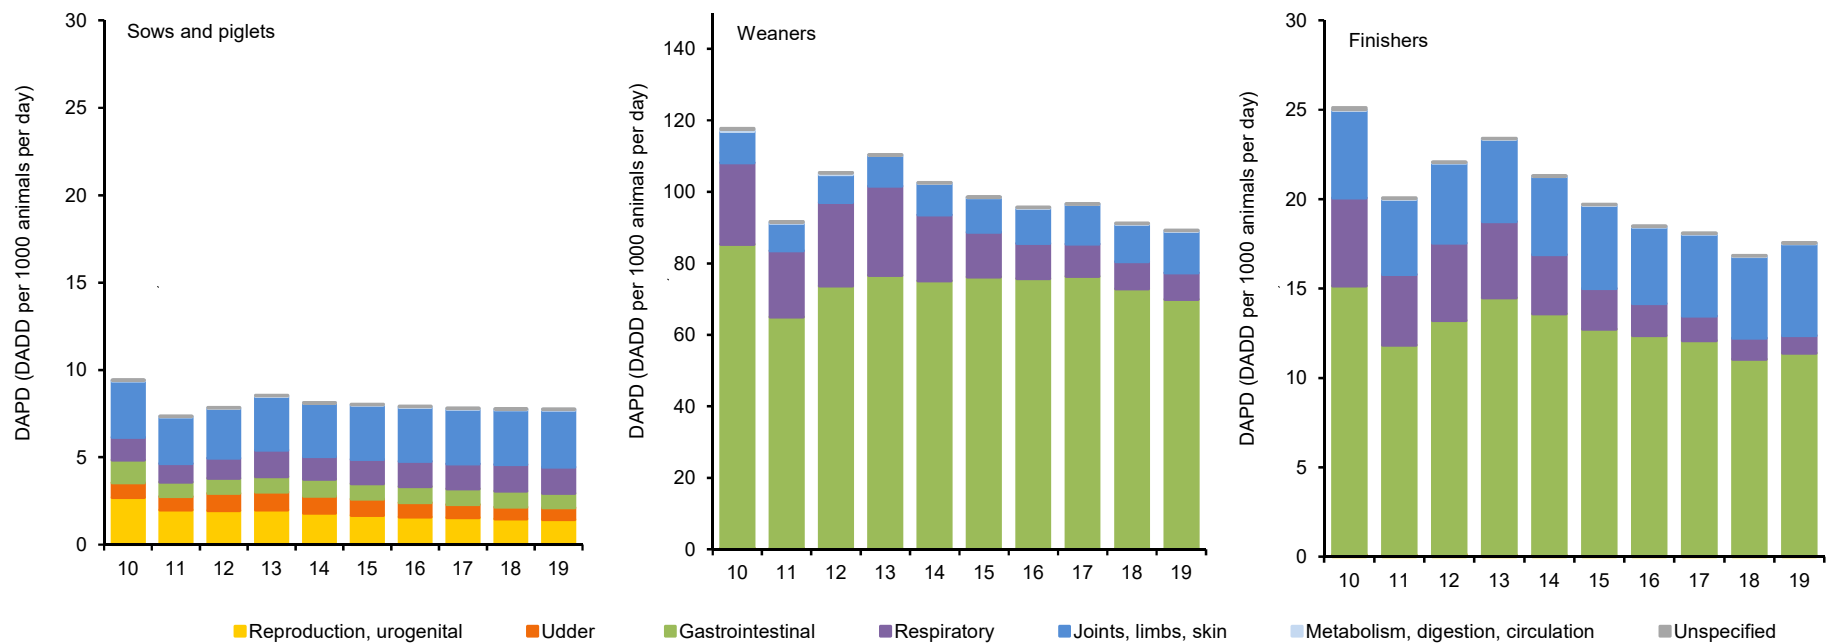

a) Aminoglycosides/benzylpenicillinprocain combinations comprise 60% of this group in 2019

b) Lincosamides/spectinomycin combinations comprise 57% of this group in 2019

c) Penicillins with extended spectrum and combination penicillins, incl. b-lactamase inhibitors, mainly amoxicillin and ampicillin

Figure A4.1 Indications for use of antimicrobial agents in pigs as recorded in Vetstat, DAPD, Denmark

DANMAP 2019

Note: The figure includes all antimicrobial agents registered for use in pigs in specific age-groups except intramammaries, gynecologicals and topical drugs. The DAPD is calculated as the number of standard doses for one kg animal divided by the estimated live biomass in the age group or the total population (in tonnes)

Please note the five-fold difference in scale on the y-axis for weaners

Table A4.2 Use of antimicrobial agents in cattle (mill. kg-doses), estimated total live biomass (mill. tonnes) and total DAPD per age group per year, Denmark

DANMAP 2019

	Cattle	10.5	[6.1-17.5]		89.5							0.9	0.9	8.8		

Vertical solid lines indicate EUCAST epidemiological cut-off values. EUCAST clinical breakpoints are indicated as vertical dotted lines if different from the corresponding epidemiological cut-off values

Confidence intervals are calculated as 95% binomial proportions presenting Wilson intervals

White fields represent the range of dilutions tested. MIC values equal to or lower than the lowest concentration tested are presented as the lowest concentration. MIC values greater than the highest concentration in the range are presented as one dilution step above the range

Vertical solid lines indicate EUCAST epidemiological cut-off values. EUCAST clinical breakpoints are indicated as vertical dotted lines if different from the corresponding epidemiological cut-off values

Confidence intervals are calculated as 95% binomial proportions presenting Wilson intervals

White fields represent the range of dilutions tested. MIC values equal to or lower than the lowest concentration tested are presented as the lowest concentration. MIC values greater than the highest concentration in the range are presented as one dilution step above the range

Nalidixic acid	6.1	[3-9]										92.4	1.1	0.4	1.5	4.6				
Colistin	0	[0-0.7]							94.3	5.7										
Spectinomycin	50.8	[45-57]											31.3	11.8	6.1	6.5	10.7	33.6		

Note: Isolates from the routine diagnostic laboratory investigation of isolates from dead and diseased pigs submitted to SEGES Pig Research Centre's Laboratory for Pig Diseases in Kjellerup. Occurrences of resistant isolates are presented according to the clinical breakpoints that are currently in use at both DTU National Veterinary Institute and Laboratory for Pig Diseases. The MIC value given is the concentration of amoxicillin. The concentration of clavulanic acid is half the concentration of amoxicillin

Vertical solid lines indicate microbiological breakpoint values for antimicrobial resistance (preferably CLSI); vertical stippled lines indicate breakpoints for intermediate sensitivity

White fields represent the range of dilutions tested. MIC values equal to or lower than the lowest concentration tested are presented as the lowest concentration. MIC values greater than the highest concentration in the range are presented as one dilution step above the range

Table A6.9 Distribution of MICs and resistance (%) among *Actinobacillus pleuropneumoniae* from pigs (n=116), Denmark

Vertical solid lines indicate EUCAST epidemiological cut-off values. EUCAST clinical breakpoints are indicated as vertical dotted lines if different from the corresponding epidemiological cut-off values. For daptomycin, an ECOFF >8 was applied for *E. faecium* (EUCAST, 30 December 2018). *E. faecalis* are assumed inherent resistant to streptogramins, and ECOFF only applies to *E. faecium*. For *E. faecium*, the EUCAST ECOFF (>1) was not applied for quinopristin/dalfopristin (tradename synergic) according to investigations presented in DANMAP 2006

Confidence intervals are calculated as 95% binomial proportions presenting Wilson intervals

White fields represent the range of dilutions tested. MIC values equal to or lower than the lowest concentration tested are presented as the lowest concentration. MIC values greater than the highest concentration in the range are presented as one dilution step above the range

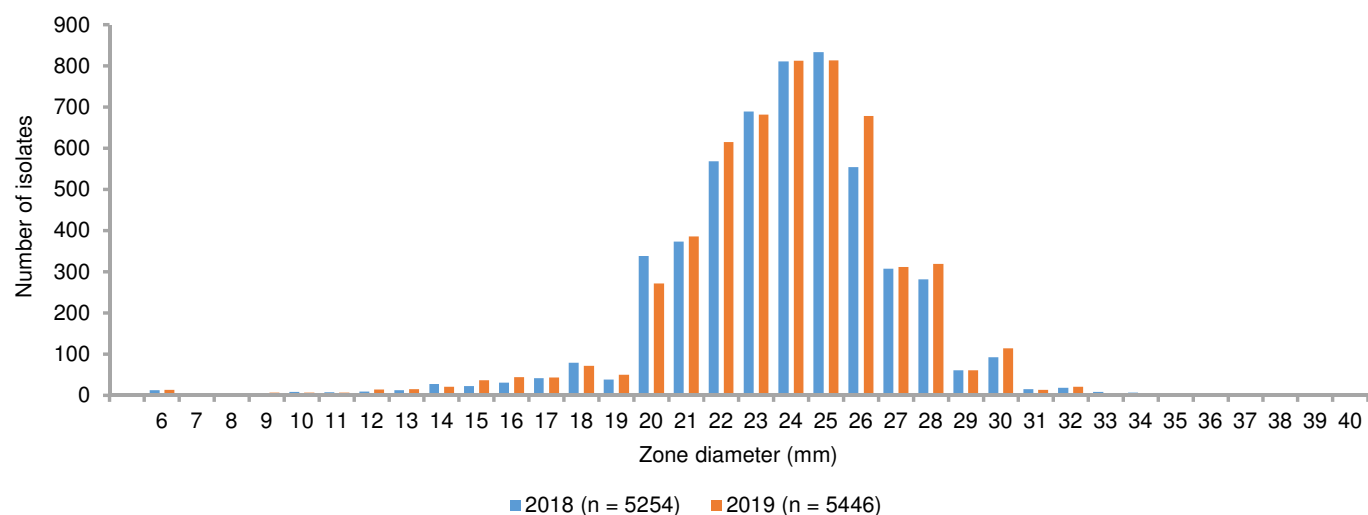

Table A7.8 Distribution (n, %) of AMR profiles in *Enterococcus faecalis* (n=91) and *Enterococcus faecium* (n=100) from pigs, Denmark

2019 AMR profiles	DANMAP 2019
